Preparing Proposals in LATEX with proposal.cls*

Michael Kohlhase Computer Science, Jacobs University Bremen http://kwarc.info/kohlhase

September 23, 2017

Abstract

The proposal class supports many of the generic elements of Grant Proposals. It is optimized towards collaborative projects, and should specialized to particular funding agencies.

1 Introduction

Writing grant proposals is a collaborative effort that requires the integration of contributions from many individuals. The use of an ASCII-based format like LATEX allows to coordinate the process via a source code control system like GIT or Subversion, allowing the proposal writing team to concentrate on the contents rather than the mechanics of wrangling with text fragments and revisions. In fact the proposal package has evolved out of a series of collaborative proposal writing efforts, where large teams (up to 30 individuals from up to 20 sites) have written a 100-page proposal in three weeks (with over 2000 commits). Such collaborative writing sprints are impossible without a revision control system and a "semantic" document class that generates tables, charts, and deliverable lists from content markup and thus takes care of many of the routine tasks of keeping information consistent.

The **proposal** class supports many of the generic elements of Grant Proposals. The package documentation is still preliminary, fragmented and incomplete.

The proposal class is distributed under the terms of the LaTeX Project Public License from CTAN archives in directory macros/latex/base/lppl.txt. Either version 1.0 or, at your option, any later version.

The CTAN archive always contains the latest stable version, the development version can be found on GitHub at https://github.com/KWARC/LaTeX-proposal. For bug reports please use the issue tracker there. Please feel free to fork the repository and provide extensions and improvements.

The development version also contains example proposals and a very useful script that generates GitHub issues for all the workpackages, tasks, and deliverables. This is a great way of starting up a project and controlling its progress. The OpenDreamKit EU project (see http://opendreamkit.org) uses this for its (very public) project planning on the issue tracker at https://github.com/OpenDreamKit after (also publicly) developing the proposal on GitHub.

Finally, the GitHub reposistory contains example project proposals and specialized Makefiles that help start off the proposal development process. These are not part of the CTAN/TeXLive distributions.

2 The User Interface

In this section we will describe the functionality offered by the proposal class along the lines of the macros and environments the class provides.

2.1 Package Options

The proposal package takes the options submit, noworkareas, RAM, deliverables, wpsubsection, keys, svninfo, gitinfo, numericcites, and public.

submit

The submit option will disable various proposal management decorations which are enabled by default for submission.

noworkareas

The noworkareas option specifies that we do not want to structure our work plan into work areas (see section 2.6).

RAM

The RAM option specifies that we specify research assistant months in the effort tallies (see section 2.6).

deliverables

The deliverables option specifies that we specify deliverables in the grant proposal (see section 2.9). As the deliverables management needs extra support, we only activate them via this option.

wpsubsection

The wpsubsection option specifies that we want to see subsections headings for the WPs (and WAs, if we have them).

report

The report option specifies that we want to use the report.cls class as a basis for proposal instead of the default article.cls.

keys The keys option specifies that we want to see the values of various keyval arguments in the

margin.

syninfo

The syninfo option specifies specifies that we want to use the syninfo package for displaying version control metadata in the document (except when the submit option is also given). For this we need the svninfo metadata line of the form

```
\SVN $Id: proposal.tex 13610 2007-07-11 04:30:16Z kohlhase $
\svnKeyword $HeadURL: https://svn.kwarc.info/../proposal.tex $
```

at the beginning of each file (or in the preamble).

gitinfo

Analogously, the gitinfo option uses the gitinfo2 package for GIT metadata. Note that you will need to install the post-commit hooks in your working copy according to [Lon] for this to

numericcites public private

The numericcites option changes citations to numeric from the default alphabetic.

Finally, the public option allows to hide certain sensitive (e.g. financial) parts of the proposal. For this, the proposal class provides the private environment. If the option public is set, the parts of the document between \begin{private} and \end{private} do not produce output. This is useful for producing public versions of the proposal that hide confidential parts. Note that both \begin{private} and \end{private} have to be on lines of their own may not have any leading whitespace otherwise an error occurs and LATEX gives error messages that are difficult to comprehend. An alternative way to distinguish private and public sections are to use the \ifpublic conditional: \ifpublic{3}\else{5}\fi will result in "5" in the submitted draft and "3" in the public document.

\ifpublic

2.2Proposal Metadata

proposal

The metadata of the proposal is specified in the proposal environment, which also generates the title page and the first section of the proposal as well as the last pages of the proposal with the signatures, enclosures, and references. The proposal environment should contain all the mandatory parts of the proposal text. The proposal environment uses the following keys to specify metadata.

title

instrument acronym acrolong

start months

since fundsuntil

discipline PΙ

- title for the proposal title (used on the title page),
- instrument for the instrument of funding that you would like to apply for.
- acronym for the proposal acronym, possibly accompanied by an acrolong that explains it. The acronym will also be used in the page headings.
- start for the start date of the proposed fragment of the project, and months for the length of the proposal in months. Both have to be specified for the proposal class to work.
- If the proposal only concerns a part of a longer-running project, the since key allows to specify the date since when the overall project runs. Finally, the fundsuntil allows to specify a date until which the funds last.
- discipline for the academic discipline and areas for the research areas in that discipline.
- PI to declare the principal investigator. For collaborative proposals we can use the PI key multiple times. The proposal package uses the workaddress package for representation of personal metadata, see [Koh16c] or the file proposal.tex for details.
- Many collaborative proposals are shared between two institutions, which we can declare with the site key. As this changes the interface this should not be used for single-institution proposals. We will describe the setup for a single-site proposal below and point out the differences. The example proposal.tex is a two-site proposal.
- Sometimes it makes sense to document the proposal number in the metadata, e.g. to use the generated metadata file $\langle main \rangle$, pdata for project reports. The proposal number can be used for that.

\pn \pnlong

site

If the acronym and acrolong are given, then they automatically define the macros \pn and \pnlong which allow to use the project acronym (project name) and its long version in the text. Note that these macros use \xspace internallly, so they do not have to be enclosed in curly braces. There are two ways of organizing the distribution of personnel resources when developing a proposal. Either the coordinator takes a *top-down approach* where she assigns person months (PM) to the respective site, of she takes a *bottom-up approach*, where the sites "request" personnel resources by marking them up in the CVs of the researchers in the site descriptions. proposal.cls supports both of these. Support for the first is configured via the topdownPM key and for the other via the botupPM key. They add respective lines for planning in the WA/WP figure (see 2.6).

topdownPM botupPM

2.3 Proposal Appearance

The proposal environment takes a second set of keyval arguments that allow to fine-tune the appearance of the proposal document. 1

• If the compactht key is given (it does not need a value), then the header tables² are made compact, i.e. the sites that do not have a contribution to the work package or work area do not get listed. This is useful for proposals with more than 8 partners.

emphbox

compactht

The proposal package supplies the emphbox environment to create boxes of emphasized material we want to call attention to.

2.4 The proposal Environment and Title Page

EdN:3

EdN:1

EdN:2

3

2.5 Objectives

objective

The work plan starts with a discussion of objectives, which may be referenced in the text later. The proposal package provides the objective environment that allows to mark up individual objectives. It takes a keyval argument with the keys id for identification, title for the objective title, and short for a short title that can be used for referencing when the title is too long. The objectives can be referenced via $OJBref\{\langle id \rangle\}$ by their label and via $OJBtref\{\langle id \rangle\}$ by label and (short if it was specified) title.

\OBJref \OBJtref

2.6 Work Areas and Work Packages

Grant proposals have another part that is often highly stylized; the work plan. This is usually structured into "work packages" — i.e. work items that address a cohesive aspect of the proposed work. These work packages are usually consecutively numbered, have a title, and an associated effort estimation. As work packages are the "atomic" planning units, they are usually heavily cross-referenced. A well-written proposal usually contains a table giving an overview over the work packages and their efforts and a Gantt chart showing the temporal distribution of the proposed work to allow the reviewers to get a clear picture of the feasibility of the research and development proposed. But this picture is also essential during the development of a proposal (which the proposal package aims to support), when the work packages (and their estimated efforts) usually change considerably. Therefore the proposal class standardizes markup for work packages and automatically computes the work package table (which can be inserted into the table via the \mathbb{wpfig} macro) and the Gantt Chart (see Section 2.12).

\wpfig workplan

To achieve the automation, work plan is marked up by the workplan environment, which sets up various internal counters and bookeeping macros. It contains texts and workpackage environments for the work packages.

workpackage

id

The purpose of the workpackage environment is to mark up a fragment of text as a work package description and specify the metadata so that it can be used in the work package table and Gantt chart generation. The metadata is specified by the following keys:

• The id key is used to specify a label for cross-referencing the work package or work area, it

¹EdNote: move the RAM, wpsectionheadings,... options here.

 $^{^2\}mathrm{EdNote}$ describe them somewhere and reference here

 $^{^3{\}rm EdNote}$: add documentation

must be document-unique.

title short wphases requires

- The title and short keys are used for the work package/group title. The short title is used in tables and should not be longer than 15 characters.
- The wphases key is used according to Section 2.8
- The requires key can be used to mark, up dependencies between tasks. If requires= $\text{taskin}\{\langle rid \rangle\}\{\langle wp \rangle\}$ is given in a task with $id=\langle t \rangle$, then task $\langle rid \rangle$ in work package $\langle wp \rangle$ must be completed for task $\langle t \rangle$ to become possible. This key will draw an arrow into the gantt chart from the end of task $\langle rid \rangle$ to $\langle t \rangle$. Note that dependencies should always point forward in time. Furthermore, note that the fact that dependencies always go from the end of the source to the beginning of the target work phase is intentional, if this does not meet your needs, then you should probably break a work phase into pieces that can be addressed separately.

RMRAM In single-site proposals, the RM (and RAM if the RAM option was given) keys are used to specify the estimated efforts to be expended on research and development in this work package. Both are specified in person months. RM is used for "researcher months" (wissenschaftlicher Mitarbeiter) and RAM for "research assistant months" (wissenschaftliche Hilfskraft).

*RM *R.AM • In multi-site proposals, the proposal package generates the keys (site)RM (and (site)RAM) where $\langle site \rangle$ is any site label declared via the site key in the top-level proposal environment. This can be used to specify the person months that the site spends on this work package (the value for work areas is automatically computed (remember to run LATEX twice for this)).

lead

• In multi-site proposals the lead key specifies the work package or work area lead, the value of this feature should be the short name of the respective partner.

swsites

• For work packages with many prospers the swsites key can be given (no value needed) to turn the site names sideways to conserve (horizontal) space.

workarea

It is often useful to group the work packages in a proposal further (especially for larger, collaborative proposals). This can be done via the workarea environment, which groups work packages. This environment takes the same keys as the workpackage environment, except for the efforts, which can be computed automatically from the work packages it groups.

As the author of the proposal class likes more structured proposals, using work areas is the default, but the proposal class can also be used with the noworkareas option for less structured (smaller) proposals.

2.7 **Tasks**

tasklist task In the work packages we can list tasks that need to be undertaken with the tasklist environment. The individual tasks are marked up with the task environment. This takes a keyval argument with the keys id for identification, title for a title, and the workphase keys wphases, start, end, and force (see Section 2.8). For planning involvement we can specify the overall person months via the PM key, the task lead via lead, and the partners involved via the partners key. Instead of just listing the partners, we can also specify the contributions of the partners with RM(site) and RAM(site) keys. Finally task dependencies can be specified via the requires key.

\taskref

\tasktref

Tasks can be referenced by the \taskref macro that takes two arguments: the work package identifier and the task identifier. As for work packages and work areas, there is a long reference variant with work package title: \tasktref. Finally, \localtaskref references a task in the local \localtaskref work package by the identifier in its argument.

Work Phase Metadata 2.8

wphases

The task and workpackage allow the wphases key to specify the a list of work phases. The value of this key is comma-separated list of work phase specifications of the form $\langle start \rangle - \langle end \rangle$ or $\langle start \rangle - \langle end \rangle ! \langle force \rangle$, where $\langle start \rangle$ and $\langle end \rangle$ delimit the run time of the work phase and the optional ! $\langle force \rangle$ specifies the work force, i.e. the intensity of work as a number between 0 and 1. If no force is given, the default is 1. The main reason for specifying this metadata for tasks is to generate a Gantt chart (see Section 2.12).

Milestones and Deliverables 2.9

Many proposal formats foresee that project progress will be tracked in the form of milestones – points in the project, where a predefined state of affairs is reached – and deliverables – tangible project outcomes that have to be delivered. Correspondingly, milestones and deliverables have to be specified in the proposal and accounted for in the project reports. To facilitate this the proposal class and its instances provide a simple infrastructure for dealing with milestones and deliverables.

milestones

\milestone

Milestones are usually given in a special table¹, which we markup up with the milestones environment that takes care of initialization and numbering issues. This contains a list of milestone descriptions via the \milestone macro which is invoked as \milestone $[\langle keys \rangle]$ { $\langle title \rangle$ } { $\langle desc \rangle$ }, where $\langle keys \rangle$ supports the keys id for identification month for specifying the milestone date (in months of the project duration). Milestones are numbered with labels whose shape can \milestone@laber customized by redefining \milestone@label and referenced by the \mileref{\langle id\rangle} and $\mathbf{\tilde{d}}$ for a reference with milestone title. $\mathbf{\tilde{d}}$ for a reference with milestone title. ber of milestones.

wpdelivs wpdeliv

\mileref \miletref

> Deliverables are usually defined as part of the work package descriptions (see Section 2.6) and listed in an overview table in a separate of the proposal. As for the milestones, we use an environment wpdelivs that contains the deliverable descriptions. These are marked up via the environment which takes an optional keyval argument for the deliverable metadata a regular argument for the title and contains the description of the deliverable as the body. For the metadata we have the keys id for the deliverable identifier, due for the target date (a number that denotes the project month), nature and dissem for specifying the deliverable nature and dissemination status (usually as short strings prescribed by the proposal template), and miles for the milestone this deliverable is targeted for (specified by the milestone identifier). For repeating deliverables (e.g. project reports), both due and miles can contain comma-separated lists. The status key gives the status of the deliverable. If it has the value canceled, then the deliverable is grayed out and it is not mentioned in the deliverables table given by \inputdelivs below.

\deliv@label \delivref \delivtref

Deliverables are numbered by labels whose shape can be customized by number, where the shape of the label can be specified by redefining \deliv@label and referenced by \delivref $\{\langle wp \rangle\}$ $\{\langle id \rangle\}$ where $\langle wp \rangle$ is the work package identifier and $\langle id \rangle$ that if the deliverable and $\langle delivtref\{\langle wp \rangle\}\{\langle id \rangle\}\}$ for a reference with title. \localdelivref can be used to reference deliverables in the same work \localdelivrefpackage. \pdatacount{\lambda} \lambda \text{gives the number of milestones of the work package \lambda \text{wp}\rangle} \pdatacount{all}{delivs} that of all deliverables (aggregating over all work packages).

\inputdelivs

Some proposal templates ask for an overview table of the deliverables which aggregates the deliverables of the respective work packages and areas ordered by due date. This can be generated with the \inputdelivs macro. This works index generation in IATEX. The wpdeliv environment writes the deliverable data to a file $\langle main \rangle$. delivs, which can be processed externally (usually just sorting with sort in Unix is sufficient) into $\langle main \rangle$. deliverables, which is then input via the \inputdelivs macro. Finally, the issue key can be used to bind the deliverable to an issue identifier in a project management system.

wadelivs wadeliv

In some proposals, also work areas can have deliverables, then the above hold analogously for wpdelivs and wadeliv environments.

Note that handling deliverables adds considerable overhead to proposal formatting and adds auxiliary files, so they are only activated if the deliverables option is given (see Section 2.1).

2.10Project Data, Referencing, and Hyperlinking

The proposal package extends the hyperlinking provided by the hyperref package it includes to work packages, work areas, Whenever these are defined using the proposal infrastructure, the class saves the relevant information in the auxiliary file (proposal).aux. This information can be referenced via the \pdataref macro, which takes three arguments.

\pdataref

¹this is the default provided by the base proposal class, it can be specialized for proposal class instances by redefining the @milestones environment and correspondingly the milestone macro.

In a reference $\pdataref{\langle type \rangle}{\langle id \rangle}{\langle aspect \rangle}$ the first argument $\langle type \rangle$ specifies the type of the object (currently one of wp, wa, and partner) to be referenced, $\langle id \rangle$ specifies the identifier of the referenced object (it matches the identifier given in the id key of the object), and $\langle aspect \rangle$ specifies the aspect of the saved information that is referenced.

\pdatarefFB

 $\label{eq:local_pdata} $$ \displaystyle \operatorname{FB}_{\langle type\rangle}_{\langle id\rangle}_{\langle a1\rangle}_{\langle a2\rangle} $$ tries first \operatorname{pdataref}_{\langle type\rangle}_{\langle id\rangle}_{\langle a1\rangle} $$ and if that is not given \operatorname{pdataref}_{\langle type\rangle}_{\langle id\rangle}_{\langle a2\rangle}.$

For a work package $\langle aspect \rangle$ can be number, (the work package number), label (the label **WP**n where n is the work package number for referencing), title (the work package title), lead the work package leader, short (a short version of the WP title for tables). For work areas we have the same aspects with analogous meanings. In all cases, the referenced information carries a hyperlink to the referenced object.

\pdataRef \pdataRefFB \pdatacount The \pdataRef and \pdataRefFB macros are variant of \pdataref and \pdataRef that also carry a hyperlink (if the hyperref package is loaded).

The \pdatacount macro gives access to the numbers of certain aspects. For instance, the number of work packages in the proposal can be cited by \pdatacount{all}{wp}, similarly for work areas (if they are enabled), and finally, \pdatacount{ $\langle wa \rangle$ }{wp} gives the number of work packages for a work area $\langle wa \rangle$. This is very useful for talking about work plans in a general way. Other objects that can be counted are deliverables (\pdatacount{all}{deliverables}) and milestones (\pdatacount{all}{milestones}).

Note that since the referenceable information is written into the project data file $\langle proposal \rangle$.pdata file, it is available for forward references. However, it will only become available when the project data file is read, so the proposal has to be formatted twice for references to be correct.

\WPref \WPtref Finally, the proposal package supplies specialized reference macros for work packages and areas. The \WPref macro takes a work package identifier as an argument and makes a reference: \WPref{\langle id}\Barrow \abbreviates \pdataRef{\psip}{\langle id}\Barrow \langle \Langle \Pref \wPref \macro is similar, but also

prints out the (short) title: $\WPref\{\langle id \rangle\}\$ abbreviates $\pdataRef\{wp\}\{\langle id \rangle\}\$ abel}: $\pdataRef\{wp\}\{\langle id \rangle\}\$ title}.

\WAref \WAtref

Unless the noworkareas macro is set, we also have the variants \WAref and \WAtref for work areas.

2.11 The Work Package Table

\wpfig

One of the most useful features of the proposal class is that we can generate an overview table for the distribution of workloads in the project fully automatically. All it takes is the \mbox{wpfig} macro. We invoke this as $\mbox{wpfig}[\langle opt \rangle]$, where $\langle opt \rangle$ contains the following keywords:

pages makes a column with page numbers of the respective work package/area description.

type makes a column with work package/area types

start, end, and length makes a columns with work package/area start/end months and length (in months).

if caption is given then the table contains an explicatory caption.

label allows to specify a label other than the default fig:wplist.

For instance \wpfig[pages,start,length,caption=Overview of Work Packages] gives a table with columns for page references, duration information, and a special caption.

\wpfigstyle

The general appearance of the table \wpfigstyle macro takes a token sequence to specialize the global appearance (mostly used for text sizes and color) of the work package table. Cell styling can be tweaked by redefining special internal macros; see section ??.

2.12 Gantt Charts

Gantt charts are used in proposals to show the distribution of activities in work packages over time.

A gantt chart is represented by the gantt environment that takes a on optional keyval argument.

xscale ys**saæp** draft The keys xscale and yscale are used to specify a scale factors for the chart so that it fits on the page. The step key allows to specify the steps (in months) of the vertical auxiliary lines. Finally, the draft key specifies that plausibility checks (that can be expensive to run) are carried out. Note that the value does not have to be given, so \begin{gantt}{draft,yscale=.5,step=3} is a perfectly good invocation.

\ganttchart

Usually, the gantt environment is not used however, since it is part of the macro that takes the same keys. This generates a whole Gantt chart automatically from the work phase specifications in the work packages. As above we have to run LATEX two times for the work phases to show up.

2.13 Coherence

Many proposals require ways to show coherence between the partners. The proposal class of
\coherencematrix's the macro \coherencematrix for this which generates a matrix of symbols specifying joint publications, project organization, software/resource development, and supervision of students by the project partners that have been declared by the \jointpub, \jointproj, \jointorga \jointsub \jointsoft, and \jointsup macros before. These macros all take a comma-separated list of site \jointsoft the identifiers as an argument. Use for instance \jointproj{a,b,c} to specify that the sites with the identifiers a, b and c have a joint project. \coherencetable is a variant which packages the coherence table in a table figure with label tab:collaboration.

\coherencetable The symbols used an be configured by redefining \jpub, \jproj, and \jorga, \jsoft, and \jpub \jsup.

\jproj

\jorga

2.14

\jsoft

\jsort \jsup

The proposal class offers some basic support for localization. This is still partial though, and I am not sure that this is the best way of setting things up. What I do is to define macros for all generated texts that can be redefined in the proposal classes that build in proposal. For instance the dfgproposal class [Koh16b] provides an option german for german-language proposals and project reports that triggers a redefinition of all of these macros at read time.

2.15 Project Management

Localization

Much of the metadata that is explicitly represented in proposals written with the proposal class is very useful for project management. For instance, it is possible to use the metadata in the $\langle main \rangle$ -pdata file to generate issues for all the tasks, work packages, and deliverables automatically. The LaTeX-proposal repository [LaTeX-proposal:git] contains an experimental script that automates that. After that, we can cross-reference them using the issue key to get extra mileage⁴

 $\begin{array}{c} \text{issue} \\ \text{EdN:4} \end{array}$

3 Limitations and Enhancements

The **proposal** is relatively early in its development, and many enhancements are conceivable. We will list them here.

1. macros cannot be used in work package and work area titles. They really mess up our \wpfig automation. The problem is that they are evaluated too early, and our trick with making them undefined while collecting the parts of the table-rows only works if we know which macros we may expect. We might specify all "allowable" macros in an optional key protectmacro, which is defined via

.

But I am not sure that this will work.

⁴EdNote: MK: how to use this?

- 2. It would be great, if in the Gantt Charts, we could include some plausibility checks (for draft = not submit mode). I can see two at the moment:
 - calculating the effort (i.e. the weight of the black area) and visualizing it. Then we could check whether that is larger than the effort declared for the work package.
 - calculating (and visualizing) the monthly effort. That should be kind of even (or it has to be explained in the positions requested).
- 3. we currently do not have a way to relate PIs to sites, but we do not really need to.

If you have other enhancements to propose or feel you can alleviate some limitation, please feel free to contact the author.

Acknowledgements

The author is indebted to Jake Hartenstein, Christoph Lange, Florian Rabe, Lutz Schröder, and Tsanko Tsankov for error reports, feature suggestions, and code snippets.

4 The Implementation

In this section we describe the implementation of the functionality of the proposal package.

4.1 Package Options and Format Initialization

We first set up the options for the package.

4.2 Proposal Metadata

pdata

Most of the metadata functionality is encapsulated into the pdata package, which is shared by the proposal and report classes. pdata.sty first loads the workaddress package from sTeX and supplies the Euro symbol.

```
98 (*pdata)
99 \RequirePackage{workaddress} [2016/07/06]
100 \RequirePackage{eurosym}
```

101 \newif\if@sites\@sitesfalse\let\prop@gen@sites=\relax%

We define the keys for metadata declarations in the proposal environment, they park their argument in an internal macro for use in the title page. The site key is the most complicated, so we take care of it first: We need a switch \if@sites that is set to true when the site key is used. Furthermore site= $\langle site \rangle$ makes new keys $\langle site \rangle$ RM and $\langle site \rangle$ RAM (if the RAM option was set) for the workpackage environment and records the sites in the \prop@gen@sites token register.

```
102 \newcounter{@site}%

proposal The proposal environment reads the metadata keys defined above, and if there were no site keys,
                   then it defines keys RM and RAM (unless the noRAM package option was given) for the workpackage
                   environment. Also it reads the project data file and opens up the project data file \pdata@out,
                   which it also closes at the end.
                         The environment calls an internal version of the environment prop@proposal that can be
                   customized by the specializing classes.

```

\decode@wphase

EdN:6

\update@*

\decode@wphase decodes a string of the form $\langle start \rangle - \langle end \rangle! \langle force \rangle$ and defines the macros \wphase@start, \wphase@end, and \wphase@force with the three parts and also computes \wphase@len. The intermediate parsing macro \decode@p@start parses out the start (a number), and passes on to \decode@p@end, which parses out the end (another number) and the force string, which is either empty (if the !\langle force \rangle part is omitted) or of the form !\langle force \rangle. In the first case the default value 1 is returned for \decode@force in the second \langle force \rangle.

- 283 \newcommand\decode@wphase[1]{\expandafter\decode@p@start#1@%
- 284 \local@count\wphase@end\advance\local@count by -\wphase@start%
- 285 \def\wphase@len{\the\local@count}}
- $286 \end{2.10} $$286 \end{2.10} art $$1-$20{\end{2.10}} arc $$1-20 \end{2.10} arc $$1-$3. Arc $$1-$

 $^{^6{\}rm EDNote}$: with the current architecture, we cannot have work areas that do not contain work packages, this leads to the error that wps is undefined in endworkplan

```
288 \ifx\@test\@empty\def\wphase@force{1}\else\decode@p@force#2\fi}
                                289 \def\decode@p@force#1!{\def\wphase@force{#1}}
                                We first iteratively decode the work phases, so that the last definition of \wphase@end remains,
\startend@wphases
                                 then we parse out the start of the first workphase to define \wphase@start
                                290 \def\wphases@start#1-#2@{\def\wphase@start{#1}}
                                291 \newcommand\startend@wphases[1]{\def\@test{#1}}
                                292 \ifx\@test\@empty\def\wphase@start{0}\def\wphase@end{0}\else%

980 \newcommand\prop@legend@requestedtotals{\textbf{requested totals}}
```

4.12 Gantt Charts

Gantt Charts are done with help of the the tikz package. The gantt environments pick up on the declared duration of the proposal in months stored in the \prop@gen@months macro.

We define the keys for Gantt tables

992 {\gantt@set{#1}\gdef\gantt@height{#2}

```
981 \newif\ifgantt@draft\gantt@draftfalse
982 \newif\ifgantt@miles\gantt@milesfalse
983 \define@key{gantt}{xscale}{\def\gantt@xscale{#1}}
984 \define@key{gantt}{yscale}{\def\gantt@xscale{#1}}
985 \define@key{gantt}{step}{\def\gantt@xscale{#1}}
986 \define@key{gantt}{size}{\def\gantt@xscale{#1}}
987 \define@key{gantt}{fizee}{\def\gantt@xize{#1}}
988 \define@key{gantt}{fizee}{\def\gantt@xize{#1}}
988 \define@key{gantt}{milestones}[true]{\gantt@milestrue}

Then we define an auxiliary function that provides defaults for these keys and sets the internal macros.

989 \def\gantt@set#1{\gantt@draftfalse\def\gantt@xscale{1}\def\gantt@yscale{.35}\def\gantt@step{3}}
990 \setkeys{gantt}{#1}}

Finally, the Gantt Chart environment itself.

gantt

The gantt[\langle keyvals\rangle \langle \langle keight \rangle \text{ environment sets up the grid and legend for a gantt chart. The grid is \prop@gen@months wide and \langle height \rangle high.

991 \newenvironment{gantt}[2][]

4.14 Relevant Papers & References

We first define a bibLaTeX bibliography heading that does not create headers, we need it somewhere.

```
1200 \defbibheading{empty}{}
```

We define an internal macro that prints a publication list of a given bibTEX entry type and title for convenience. It also adds a notype= to the token register \prop@rl to deal with the unclassified entries from the list.

```
1201 \newif\if@allpapers\@allpaperstrue
1202 \newcommand\prop@ppl[3][]{\@allpapersfalse\message{ppl processing: #2}%
1203 \printbibliography[heading=subbibliography,type=#2,title=#3#1]%
1204 \end{prop@rl}{\xdef\prop@rl{#2}}{\xdef\prop@rl{\prop@rl}, #2}}
 The following code does not work yet, it would have been nice to be able to just add a key
 unclassified to catch the unclassified ones. I guess we just have to issue a warning instead.
1205 \newcommand\prop@prl[1] {\message{unclassified: #1}%
1206 \printbibliography[heading=subbibliography,title=Unclassified,#1]}%
1207 \define@key{paperlist}{unclassified}[true]{\message{unclass: \prop@rl}\prop@rl\prop@rl}
 with this, we define a couple of keys that generate
1208 \define@key{paperlist}{articles}[true]{\prop@ppl{article}}{Articles}}
1209 \define@key{paperlist}{chapters}[true]{\prop@ppl{inbook}{Book Chapters}}
1210 \define@key{paperlist}{confpapers}[true]{\prop@ppl[,keyword=conference]{inproceedings}{Conference Papers}}
1211 \define@key{paperlist}{wspapers}[true] {\prop@ppl[,notkeyword=conference] {inproceedings}{Workshop Papers}}
1212 \define@key{paperlist}{theses}[true]{\prop@ppl{thesis}{Theses}}
1213 \define@key{paperlist}{submitted}[true]{\prop@ppl[,keyword=submitted]{unpublished}{Submitted}}
1214 \define@key{paperlist}{books}[true]{\prop@ppl{book}{Monographs}}
1215 \define@key{paperlist}{techreports}[true]{\prop@ppl{techreport}}{Technical Reports}}
```

featured We introduce a new bibLaTeX category featured for those papers that were already mentioned in \prop@paperlist and the macros defined from it.

1216 \DeclareBibliographyCategory{featured}

\prop@paperlist \prop@paperlist{ $\langle keys \rangle$ }{ $\langle refs \rangle$ } generates a paper list from a list $\langle keys \rangle$ of bibliography keys. It makes some local adaptions to the appearance of the bibliography, and then adds $\langle refs \rangle$ to the citable papers marks them as featured. Then it uses \printbibliography to make a bibliography EdN:13 of the cited papers. Note that these are not cited again in the main bibliography¹³

1217 \newcommand\prop@paperlist[2][]{%

1218 \let\biboldfont\bibfont%
